

Computer Communications and Networks

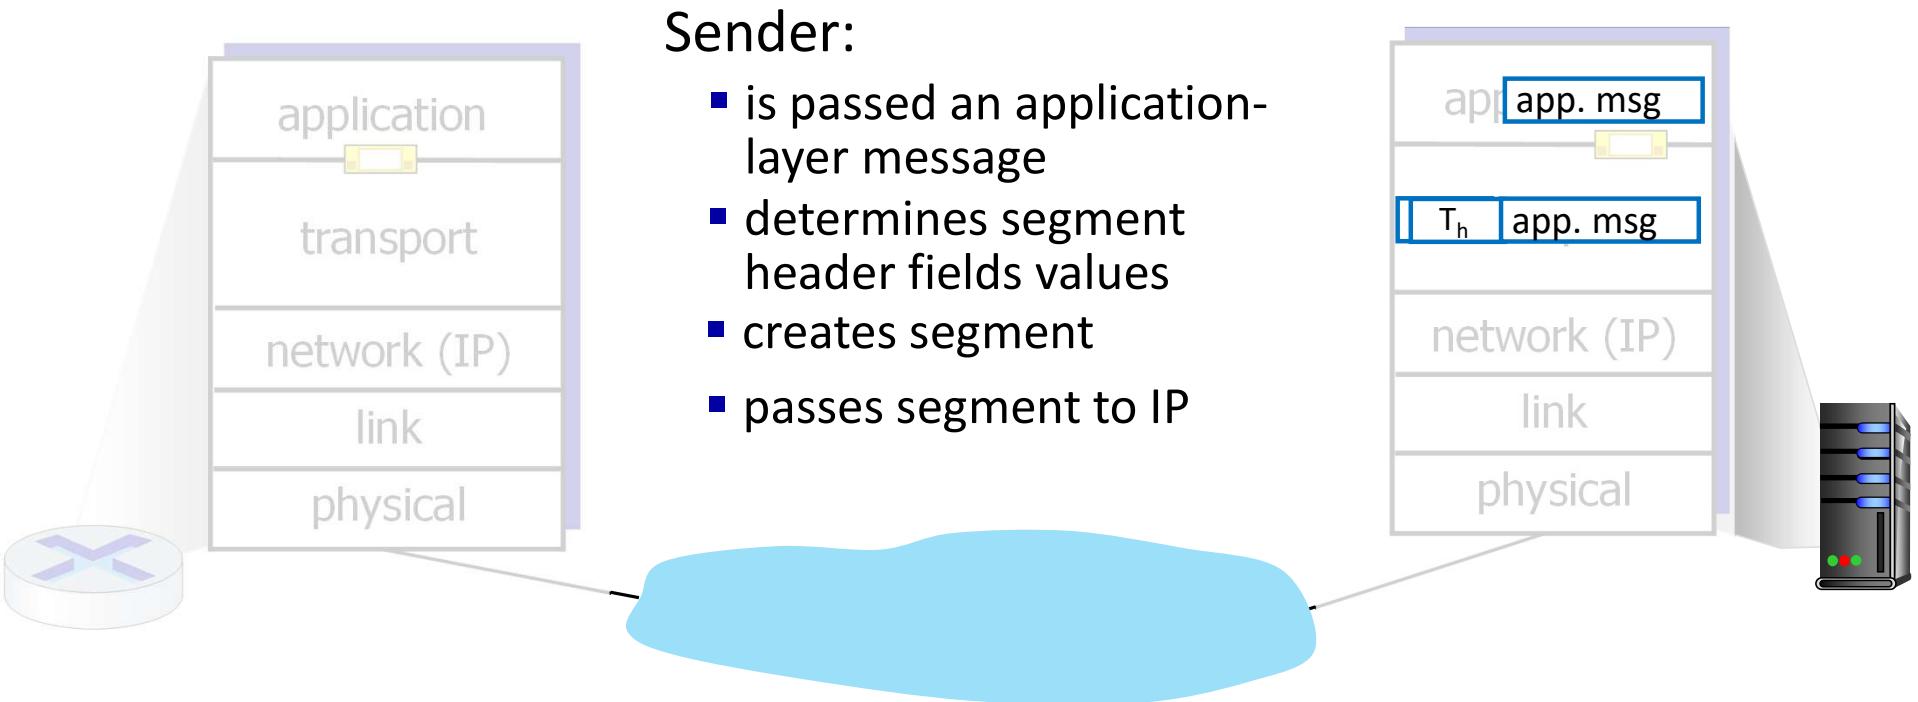

Part 3:
Transport Layer

Transport layer: roadmap

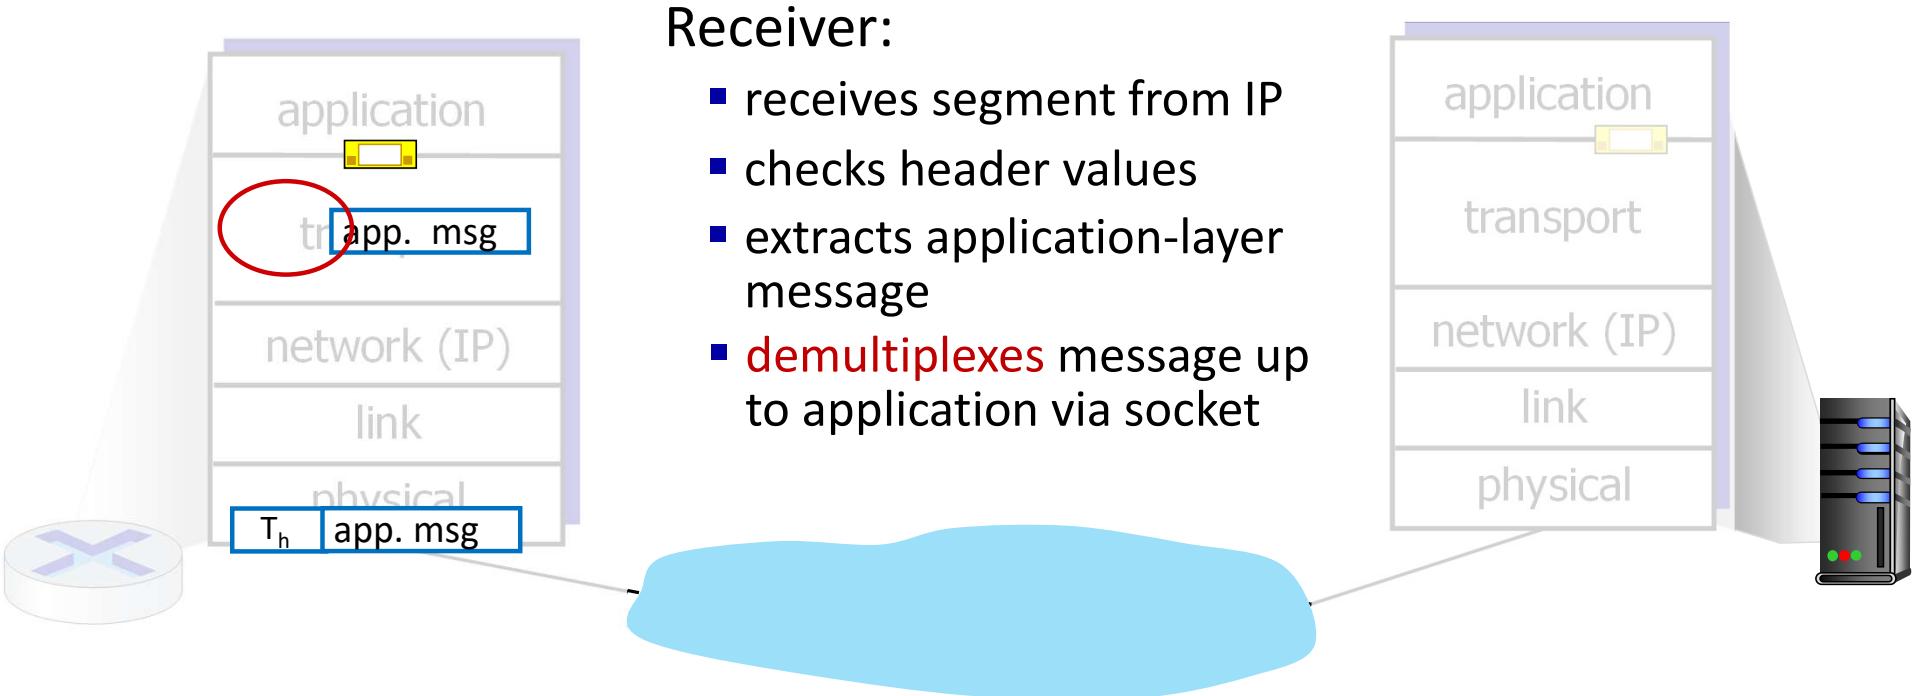

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Connection-oriented transport: TCP
- TCP flow control
- TCP congestion control
- TCP connection management

Transport Layer Actions

Source: Kurose & Ross

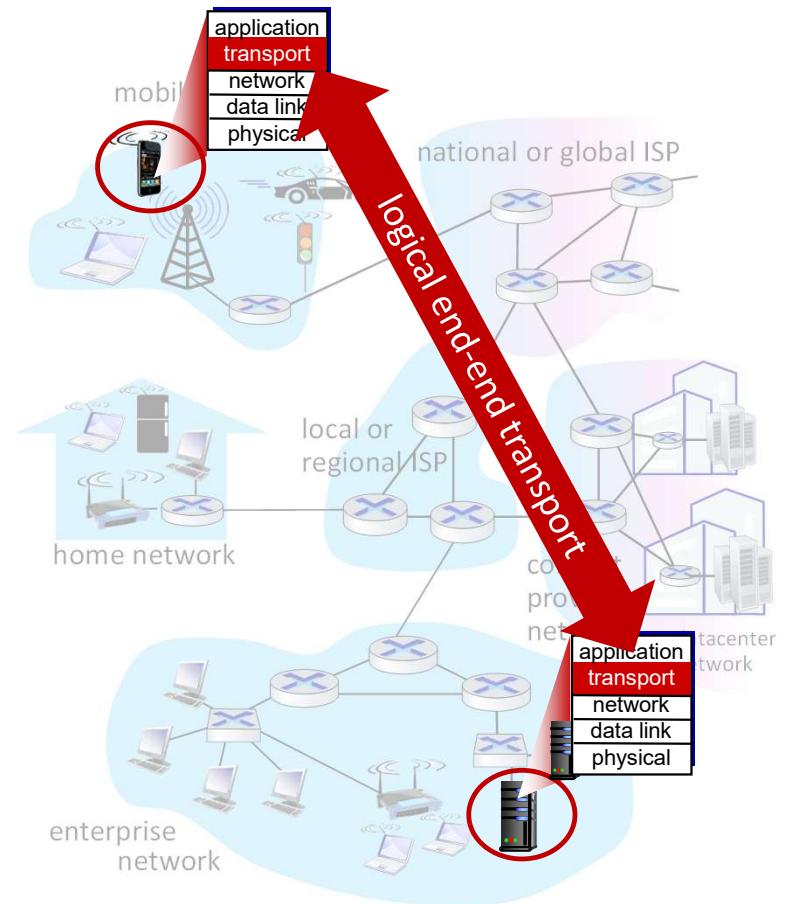

Transport Layer Actions

Source: Kurose & Ross

Transport services

- provide *logical communication between application processes* running on different hosts
- transport protocols actions in end systems:
 - sender: breaks application messages into *segments*, passes to network layer
 - receiver: reassembles segments into messages, passes to application layer
- two transport protocols available to Internet applications
 - TCP, UDP

Source: Kurose & Ross

Network layer services

- Services provided by network layer
 - move packets from one end-host to another: *logical communication between hosts*
 - possibly through many intermediate routers
- Example: Internet network-layer services
 - IP: store-and-forward packet switching
 - packets may get
 - lost at communication link, router or receiver buffer
 - duplicated
 - corrupted
 - reordered

Q: possible causes?

Transport layer protocols

- Protocol mechanisms
 - addressing and multiplexing
 - how to identify an *endpoint* in an *end-host*
 - connection management
 - for connection-oriented transport services
 - flow control: avoid overwhelming the receiver
 - error control
 - for reliable transport services
 - congestion control: avoid overloading the network

Two principal Internet transport protocols

- **TCP:** Transmission Control Protocol

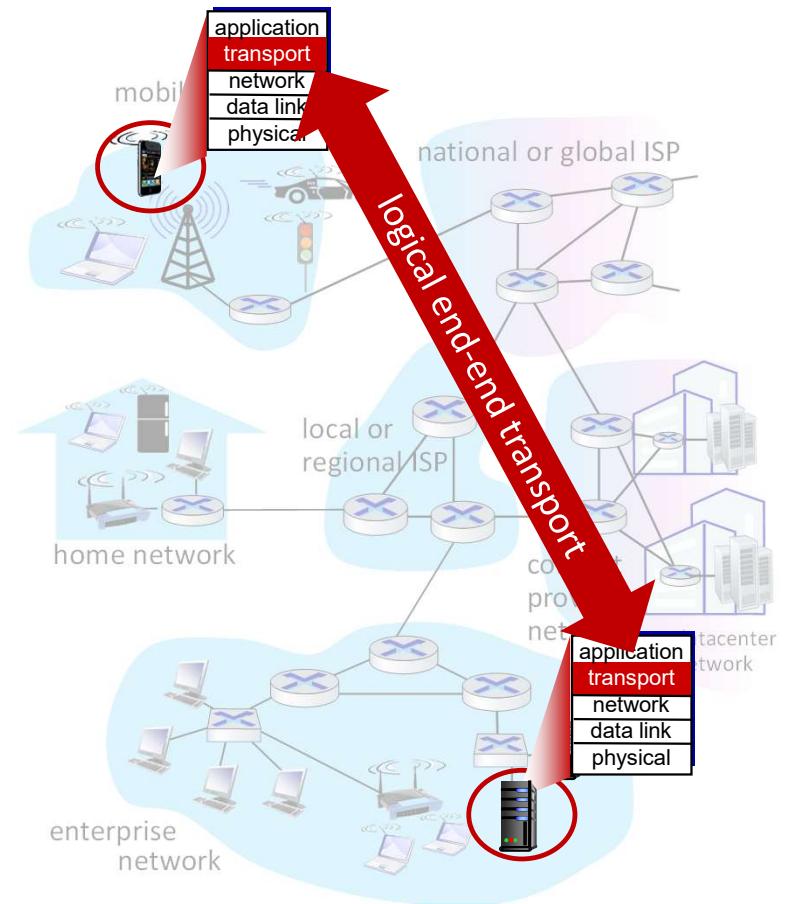

- reliable, in-order delivery
- congestion control
- flow control
- connection setup

- **UDP:** User Datagram Protocol

- unreliable, unordered delivery
- no-frills extension of “best-effort” IP

- services *not* available:

- delay guarantees
- bandwidth guarantees

Source: Kurose & Ross

Transport layer: roadmap

- Transport-layer services
- **Multiplexing and demultiplexing**
- Connectionless transport: UDP
- Connection-oriented transport: TCP
- TCP flow control
- TCP congestion control
- TCP connection management

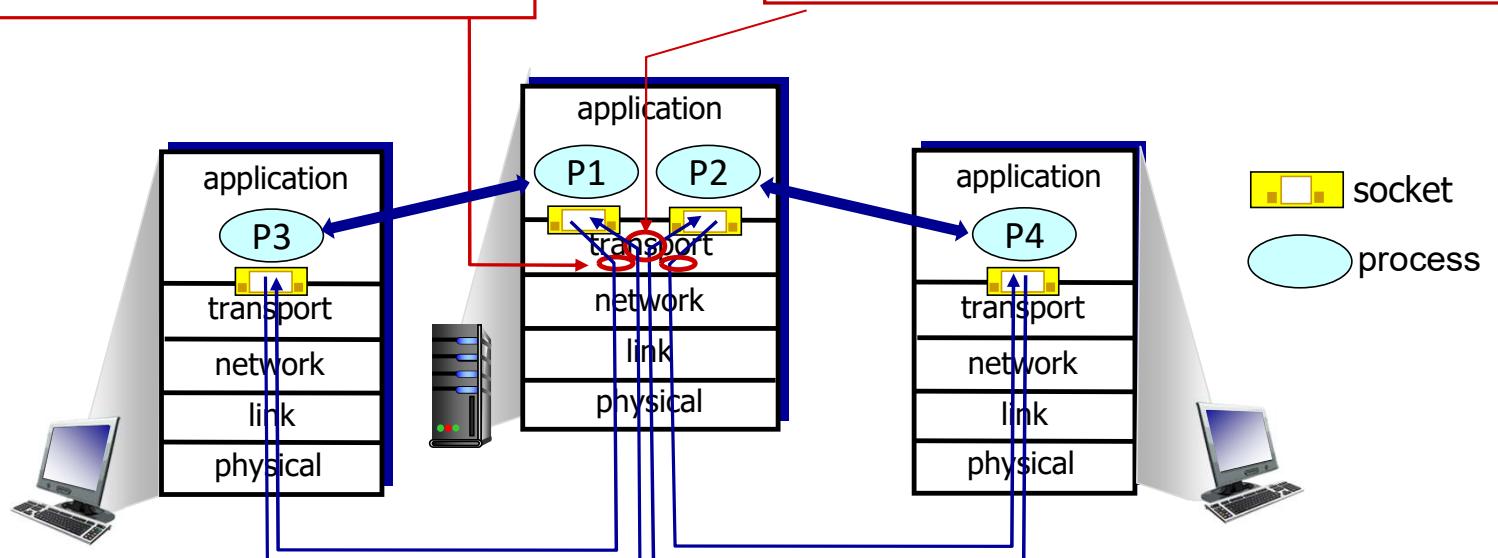

Multiplexing/demultiplexing

multiplexing as sender:

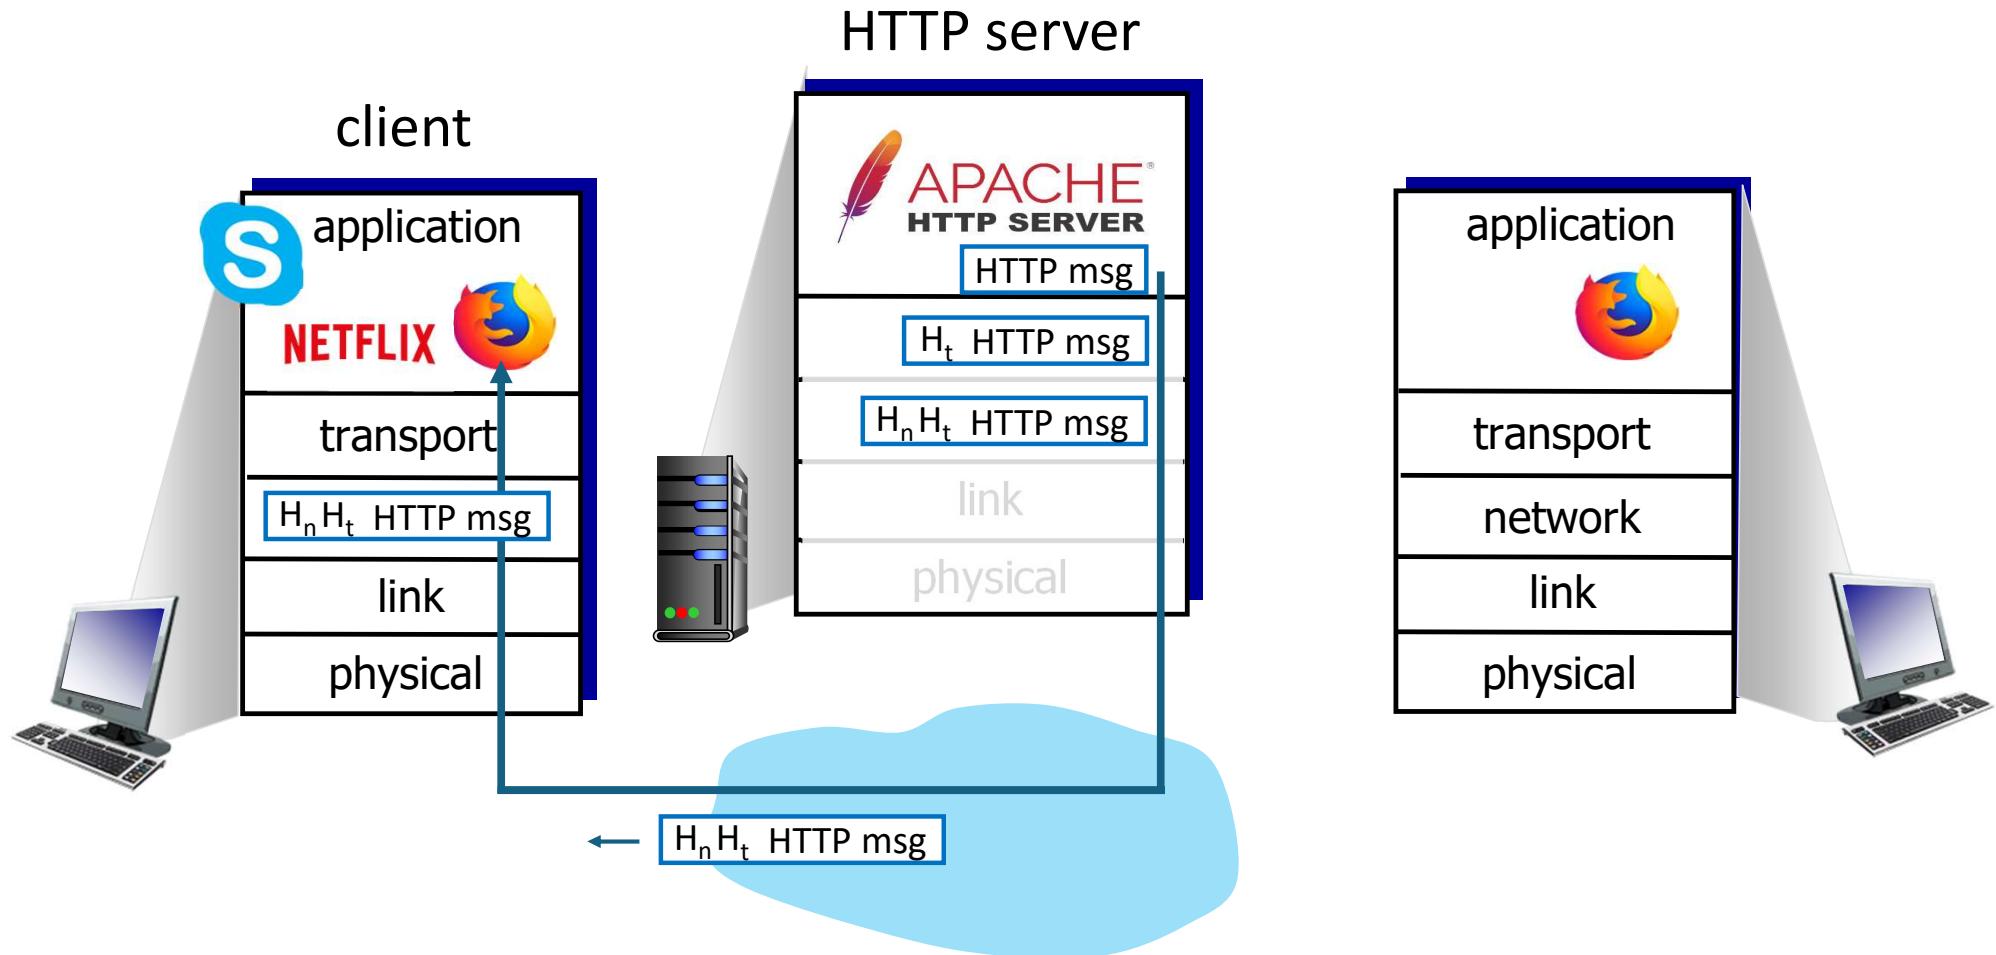

handle data from multiple sockets, add transport header
(later used for demultiplexing)

demultiplexing as receiver:

use header info to deliver received segments to correct socket

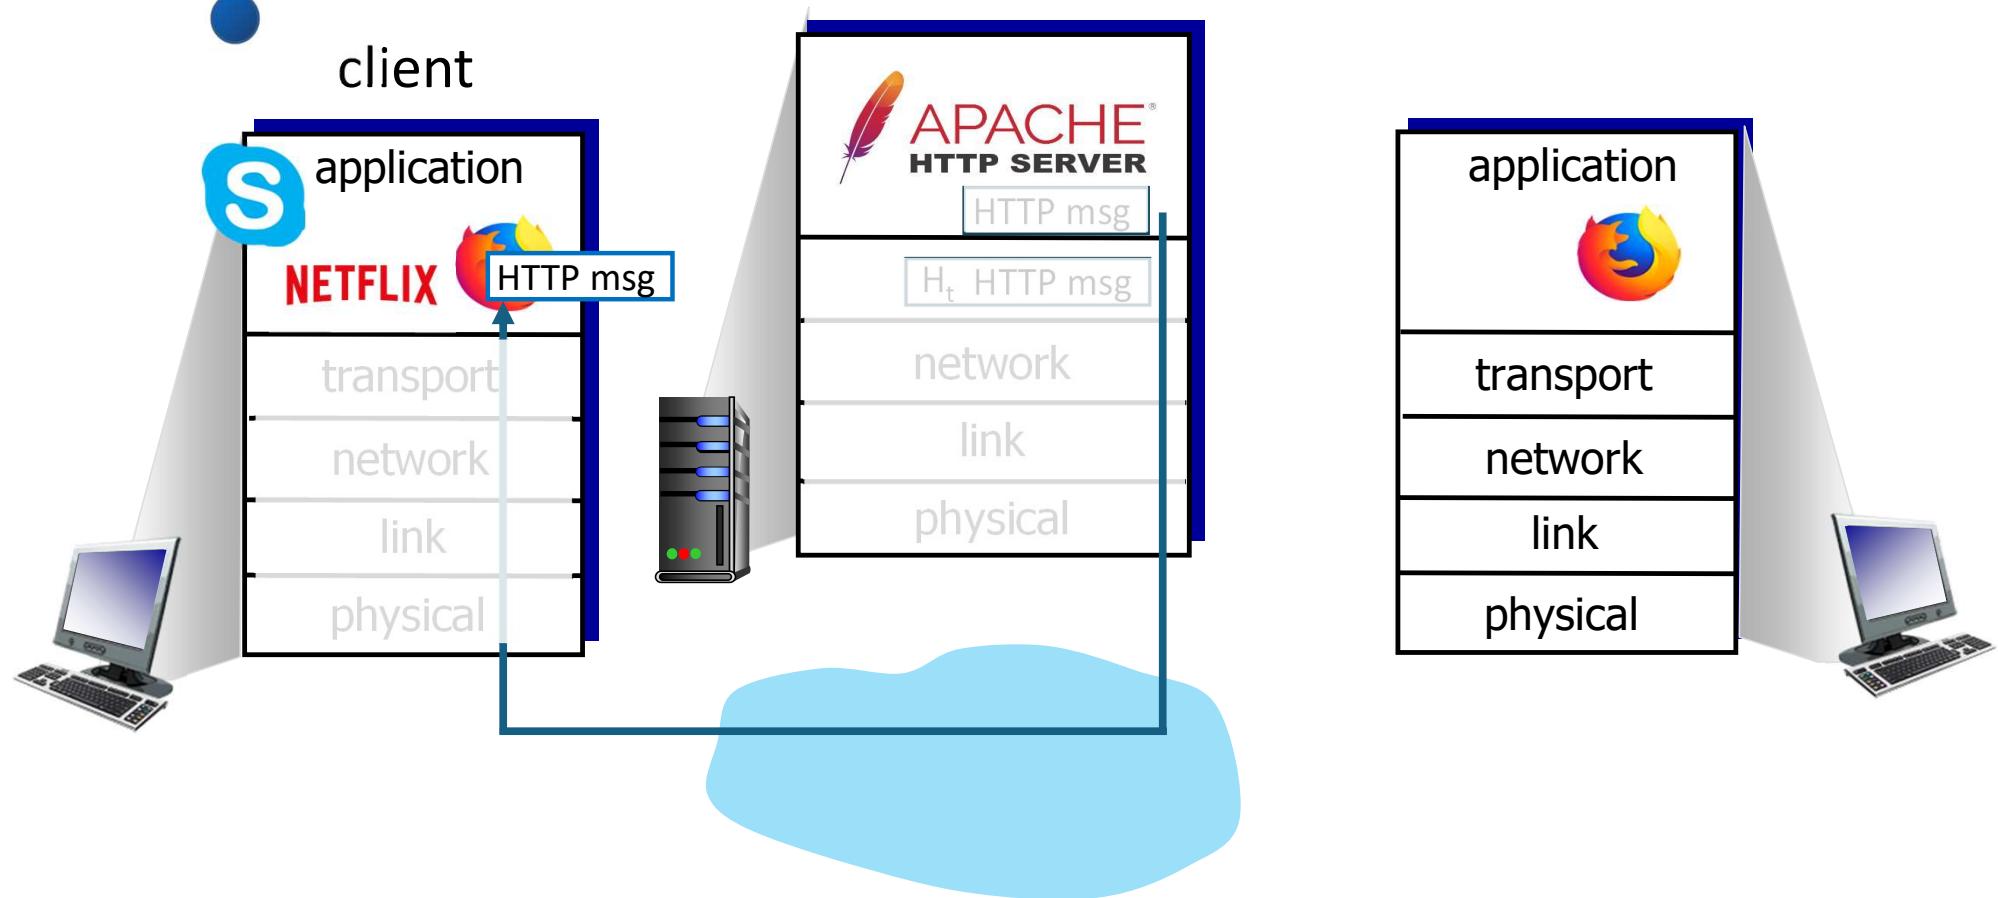

Source: Kurose & Ross

Source: Kurose & Ross

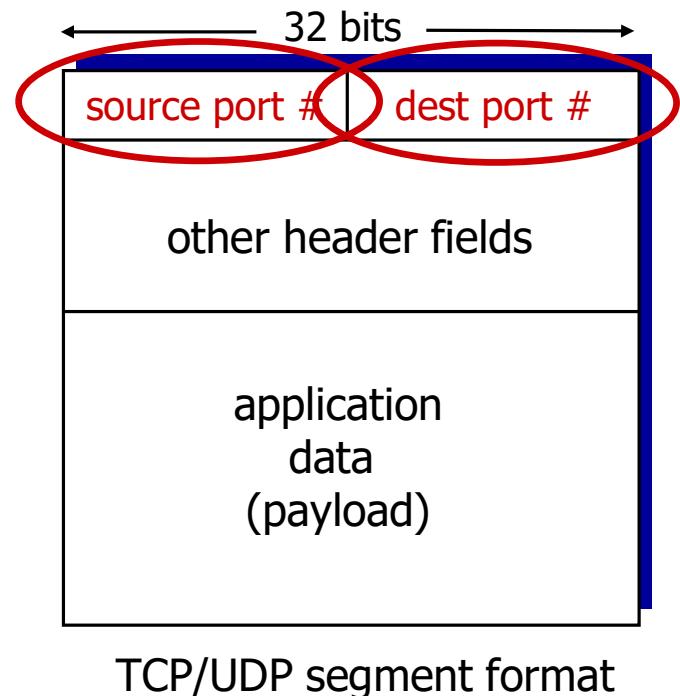

Q: how did transport layer know to deliver message to Firefox browser process rather then Netflix process or Skype process?

Source: Kurose & Ross

How demultiplexing works

- host receives IP datagrams
 - each datagram has source IP address, destination IP address
 - each datagram carries one transport-layer segment
 - each segment has source, destination port number
- host uses *IP addresses & port numbers* to direct segment to appropriate socket

Source: Kurose & Ross

Connectionless demultiplexing

Recall:

- when creating socket, must specify *host-local* port #:

```
DatagramSocket mySocket1  
= new DatagramSocket(12534);
```

- when creating datagram to send into UDP socket, must specify
 - destination IP address
 - destination port #

when receiving host receives UDP segment:

- checks destination port # in segment
- directs UDP segment to socket with that port #

IP/UDP datagrams with *same dest. port #*, but different source IP addresses and/or source port numbers will be directed to *same socket* at receiving host

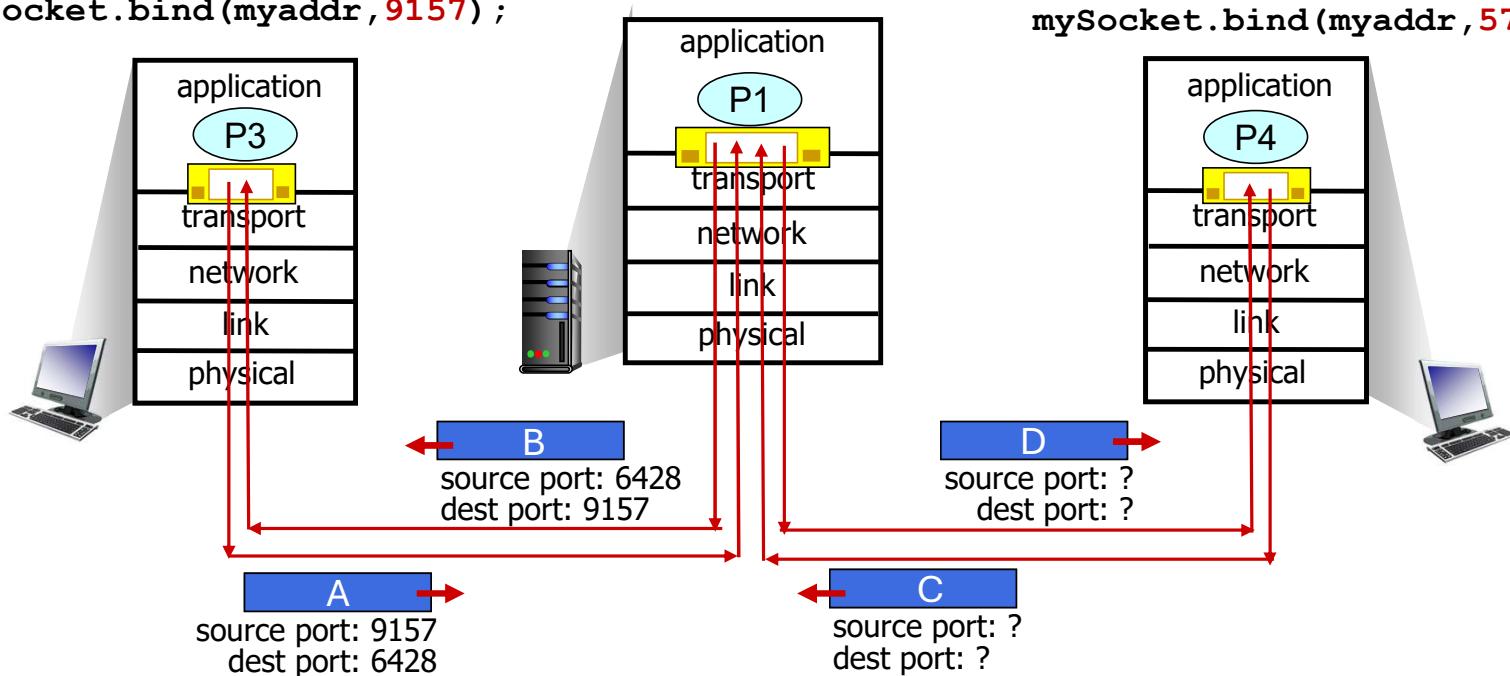

Source: Kurose & Ross

Connectionless demultiplexing: an example

```
mySocket =  
    socket(AF_INET, SOCK_DGRAM)  
mySocket.bind(myaddr, 6428);
```

```
mySocket =  
    socket(AF_INET, SOCK_STREAM)  
mySocket.bind(myaddr, 9157);
```

```
mySocket =  
    socket(AF_INET, SOCK_STREAM)  
mySocket.bind(myaddr, 5775);
```

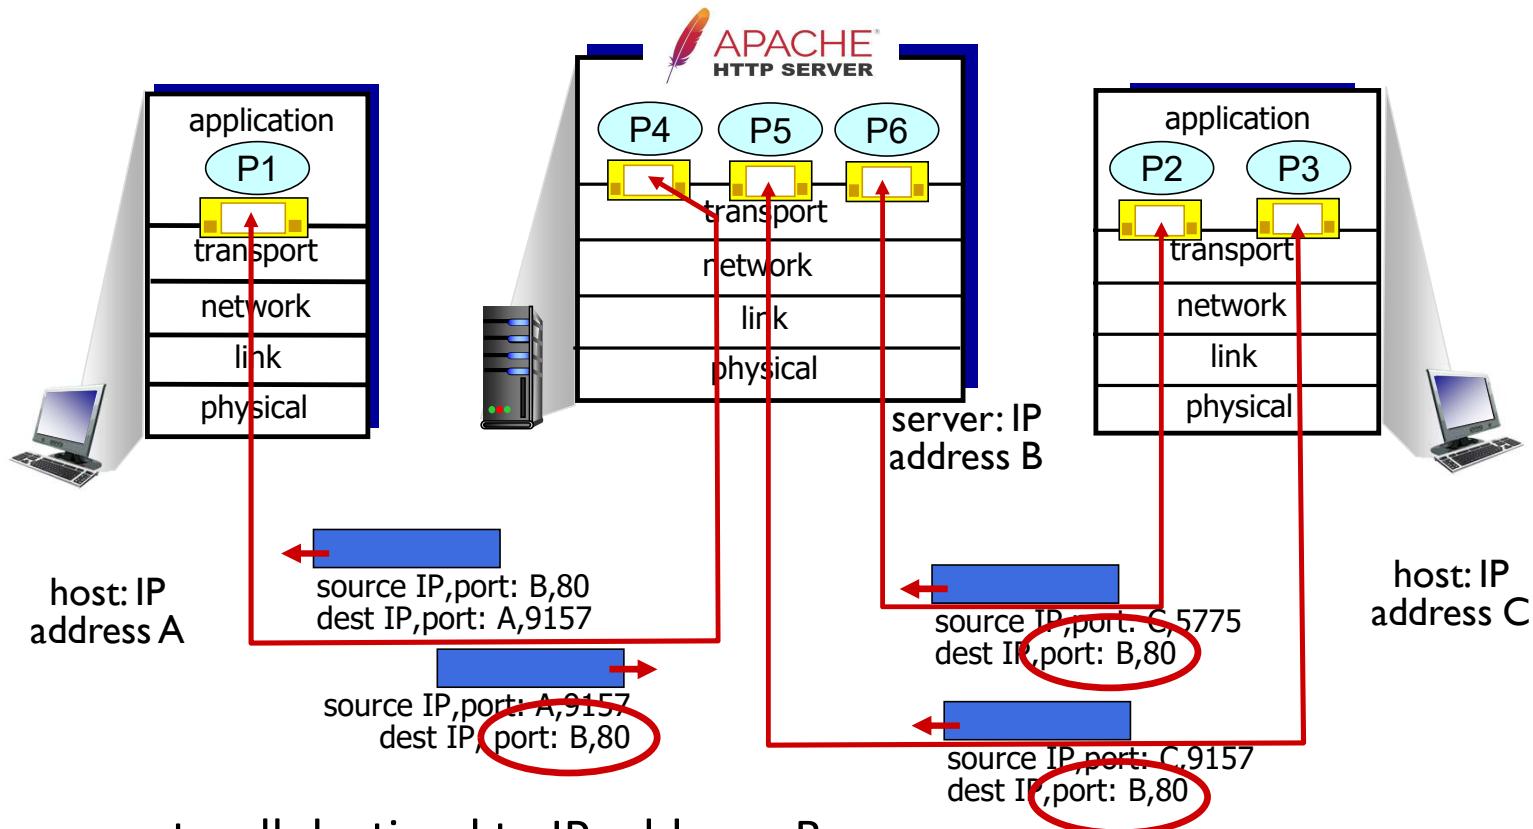

Source: Kurose & Ross

Connection-oriented demultiplexing

- TCP socket identified by **4-tuple**:
 - source IP address
 - source port number
 - dest IP address
 - dest port number
- demux: receiver uses *all four values (4-tuple)* to direct segment to appropriate socket
- server may support many simultaneous TCP sockets:
 - each socket identified by its own 4-tuple
 - each socket associated with a different connecting client

Connection-oriented demultiplexing: example

Three segments, all destined to IP address: B,
dest port: 80 are demultiplexed to *different* sockets

Source: Kurose & Ross

Transport layer: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- **Connectionless transport: UDP**
- Connection-oriented transport: TCP
- TCP flow control
- TCP congestion control
- TCP connection management

UDP: User Datagram Protocol

- “no frills,” “bare bones” Internet transport protocol
- “best effort” service, UDP segments may be:
 - lost
 - delivered out-of-order to app
- *connectionless*:
 - no handshaking between UDP sender, receiver
 - each UDP segment handled independently of others

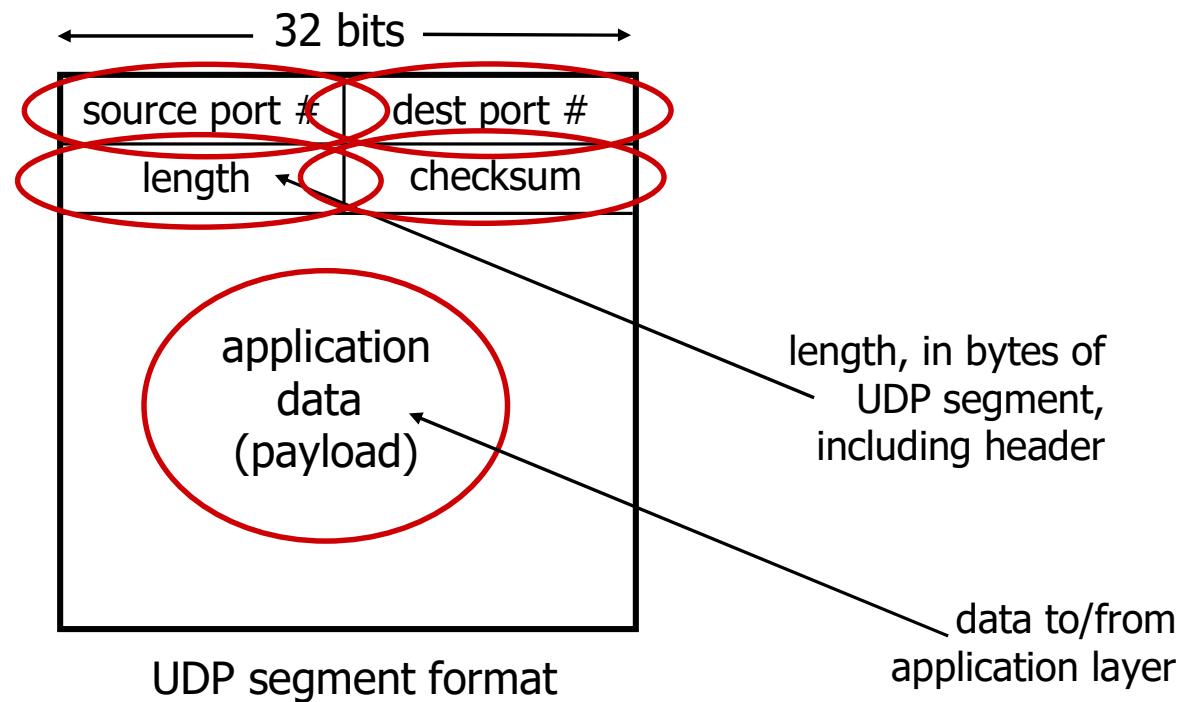

Why is there a UDP?

- no connection establishment (which can add RTT delay)
- simple: no connection state at sender, receiver
- small header size
- no congestion control
 - UDP can blast away as fast as desired!
 - can function in the face of congestion

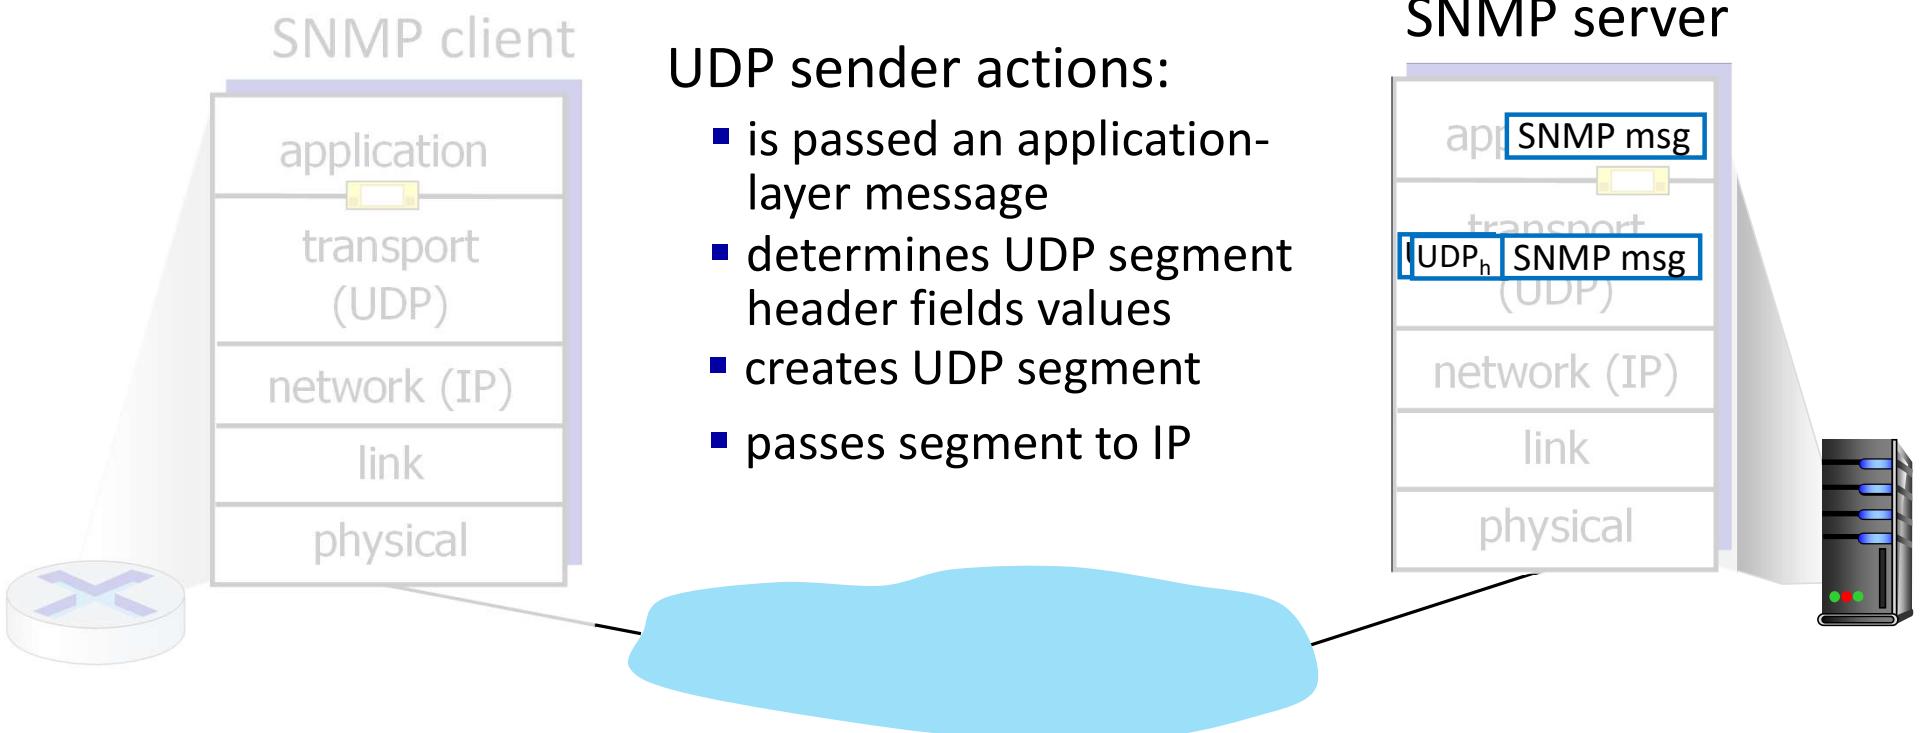

UDP: User Datagram Protocol

- UDP use:
 - streaming multimedia apps (loss tolerant, rate sensitive)
 - DNS
 - SNMP
 - HTTP/3
- if reliable transfer needed over UDP (e.g., HTTP/3):
 - add needed reliability at application layer
 - add congestion control at application layer

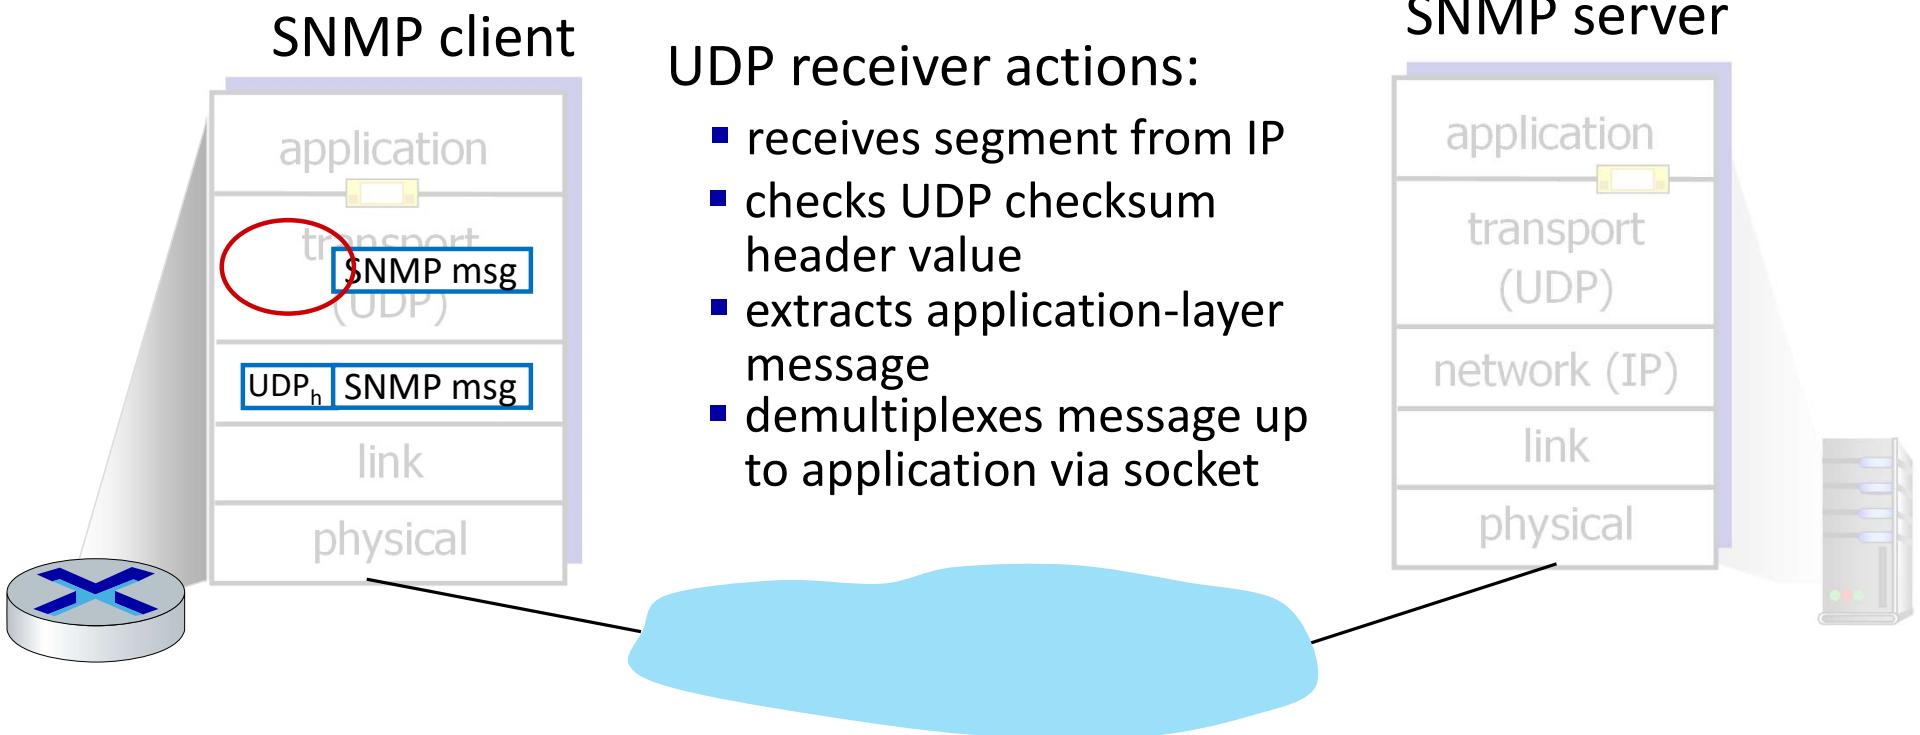

UDP segment header

UDP: Transport Layer Actions

UDP: Transport Layer Actions

Internet checksum

Goal: detect errors (*i.e.*, flipped bits) in transmitted segment

sender:

- treat contents of UDP segment (including UDP header fields and IP addresses) as sequence of 16-bit integers
- **checksum:** addition (one's complement sum) of segment content
- checksum value put into UDP checksum field

receiver:

- compute checksum of received segment
- check if computed checksum equals checksum field value:
 - not equal - error detected
 - equal - no error detected. *But maybe errors nonetheless? More later*

Internet checksum: an example

example: add two 16-bit integers

| | | | | | | | | | | | | | | | | |
|----------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 |
| | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| <hr/> | | | | | | | | | | | | | | | | |
| | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 |
| <hr/> | | | | | | | | | | | | | | | | |
| sum | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| checksum | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |

Note: when adding numbers, a carryout from the most significant bit needs to be added to the result

* Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose_ross/interactive/

Transport layer: roadmap

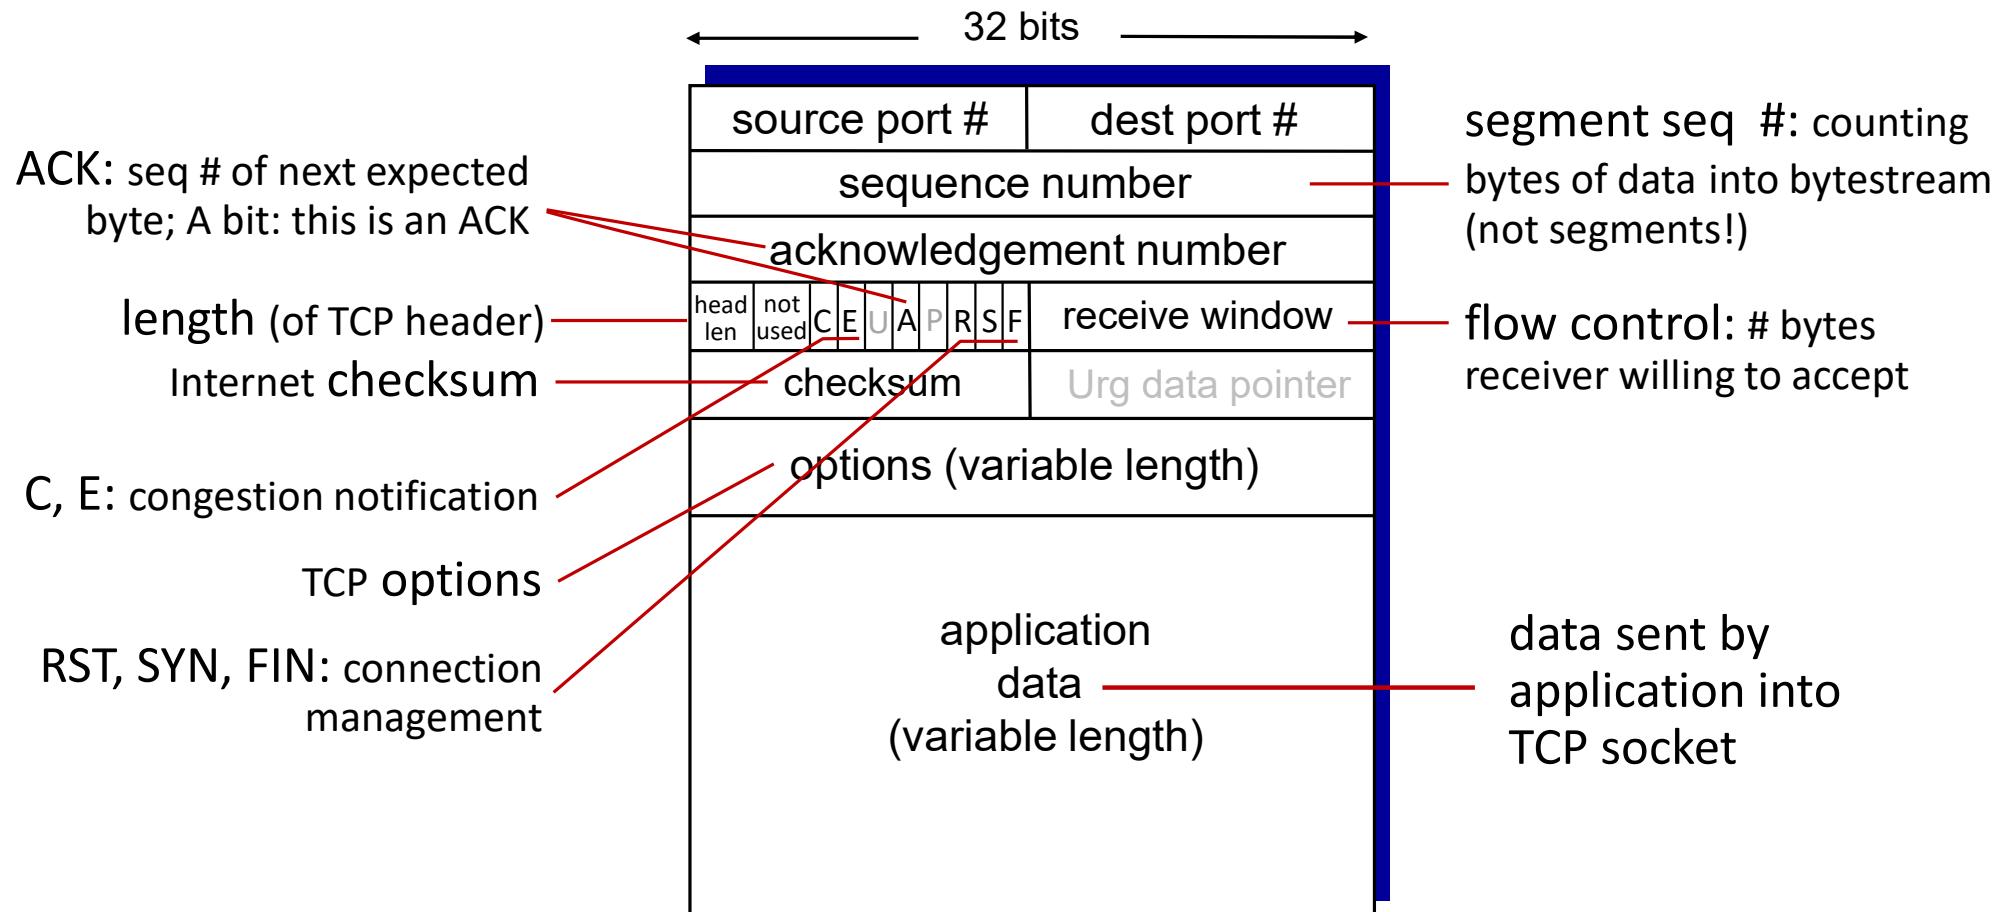

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- **Connection-oriented transport: TCP**
 - segment structure
 - reliable data transfer: Go-Back-N, SR
 - reliable data transfer: TCP
- TCP flow control
- TCP congestion control
- TCP connection management

TCP: overview

RFCs: 793, 1122, 2018, 5681, 7323

- point-to-point:
 - one sender, one receiver
- reliable, in-order *byte stream*:
 - no “message boundaries”
- full duplex data:
 - bi-directional data flow in same connection
 - MSS: maximum segment size
- cumulative ACKs
- pipelining:
 - TCP congestion and flow control set window size
- connection-oriented:
 - handshaking (exchange of control messages) initializes sender, receiver state before data exchange
- flow controlled:
 - sender will not overwhelm receiver

TCP segment structure

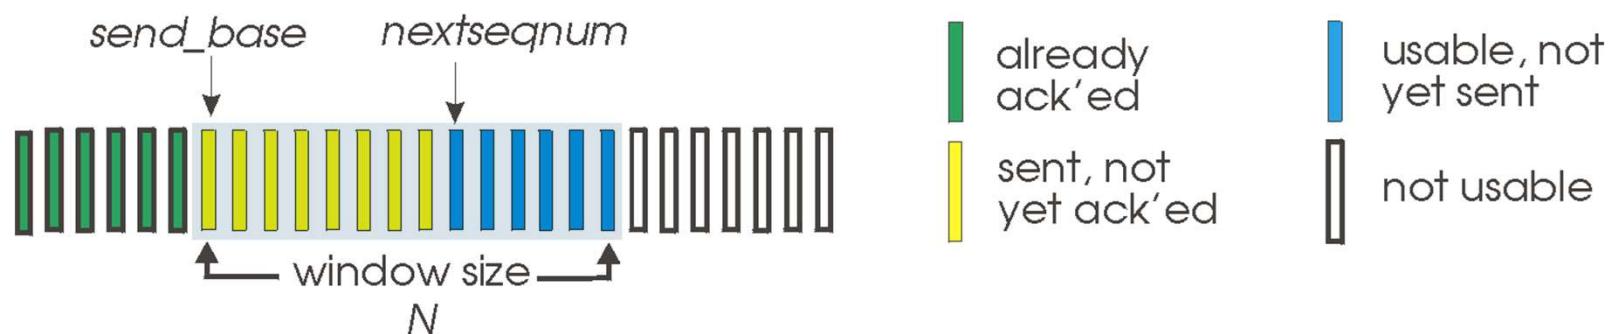

Transport layer: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Connection-oriented transport: TCP
 - segment structure
 - **reliable data transfer: Go-Back-N, SR**
 - reliable data transfer: TCP
- TCP flow control
- TCP congestion control
- TCP connection management

Go-Back-N: sender

- sender: “window” of up to N , consecutive transmitted but unACKed pkts
 - k -bit seq # in pkt header

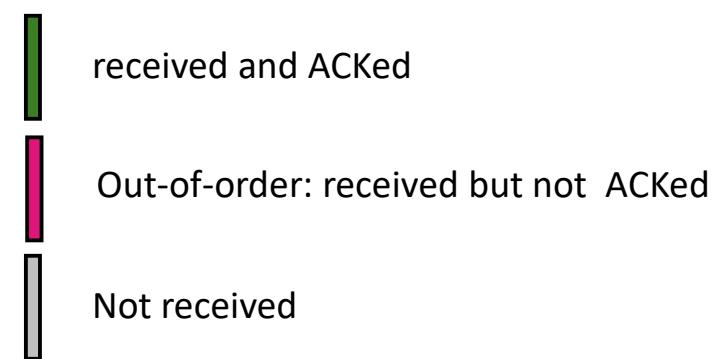

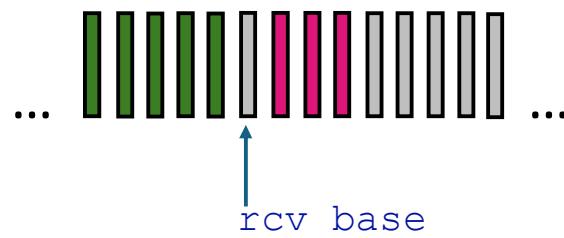

- *cumulative ACK*: $\text{ACK}(n)$: ACKs all packets up to, including seq # n
 - on receiving $\text{ACK}(n)$: move window forward to begin at $n+1$
- timer for oldest in-flight packet
- $\text{timeout}(n)$: retransmit packet n and all higher seq # packets in window

Go-Back-N: receiver

- ACK-only: always send ACK for correctly-received packet so far, with highest *in-order* seq #
 - may generate duplicate ACKs
 - need only remember `rcv_base`
- on receipt of out-of-order packet:
 - can discard (don't buffer) or buffer: an implementation decision
 - re-ACK pkt with highest in-order seq #

Receiver view of sequence number space:

Go-Back-N in action

sender window ($N=4$)

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

sender

send pkt0
send pkt1
send pkt2
send pkt3
(wait)

pkt 2 timeout

receiver

receive pkt0, send ack0
receive pkt1, send ack1

receive pkt3, discard,
(re)send ack1

receive pkt4, discard,
(re)send ack1

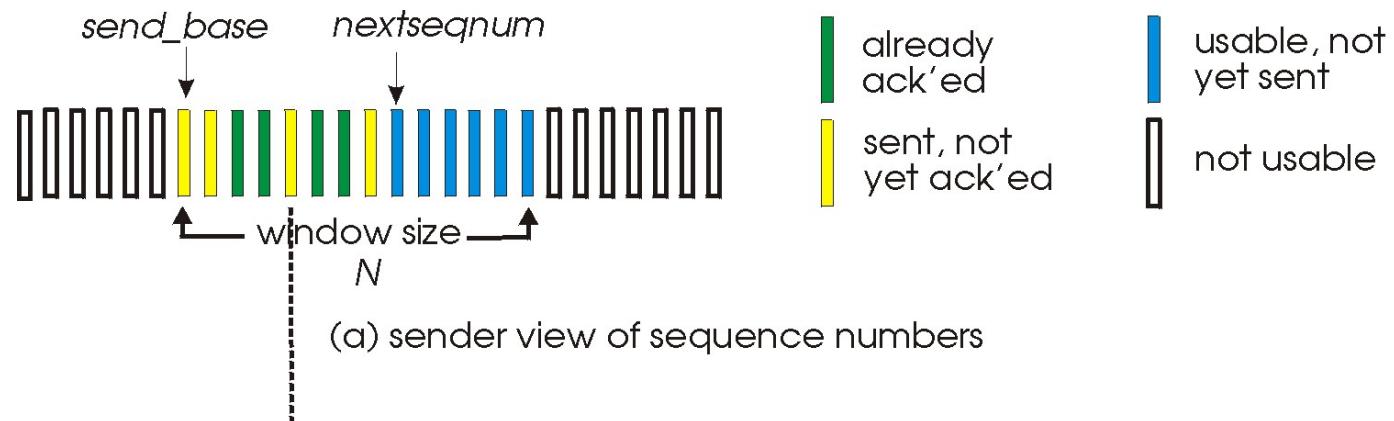

receive pkt5, discard,
(re)send ack1

rcv pkt2, deliver, send ack2
rcv pkt3, deliver, send ack3
rcv pkt4, deliver, send ack4
rcv pkt5, deliver, send ack5

Selective repeat: the approach

- *pipelining: multiple packets in flight*
- *receiver individually ACKs* all correctly received packets
 - buffers packets, as needed, for in-order delivery to upper layer
- sender:
 - maintains (conceptually) a timer for each unACKed pkt
 - timeout: retransmits single unACKed packet associated with timeout
 - maintains (conceptually) “window” over N consecutive seq #s
 - limits pipelined, “in flight” packets to be within this window

Selective repeat: sender, receiver windows

Selective repeat: sender and receiver

sender

data from above:

- if next available seq # in window, send packet

timeout(n):

- resend packet n , restart timer

ACK(n) in [sendbase,sendbase+N-1]:

- mark packet n as received
- if n smallest unACKed packet, advance window base to next unACKed seq #

receiver

packet n in [rcvbase, rcvbase+N-1]

- send ACK(n)
- out-of-order: buffer
- in-order: deliver (also deliver buffered, in-order packets), advance window to next not-yet-received packet

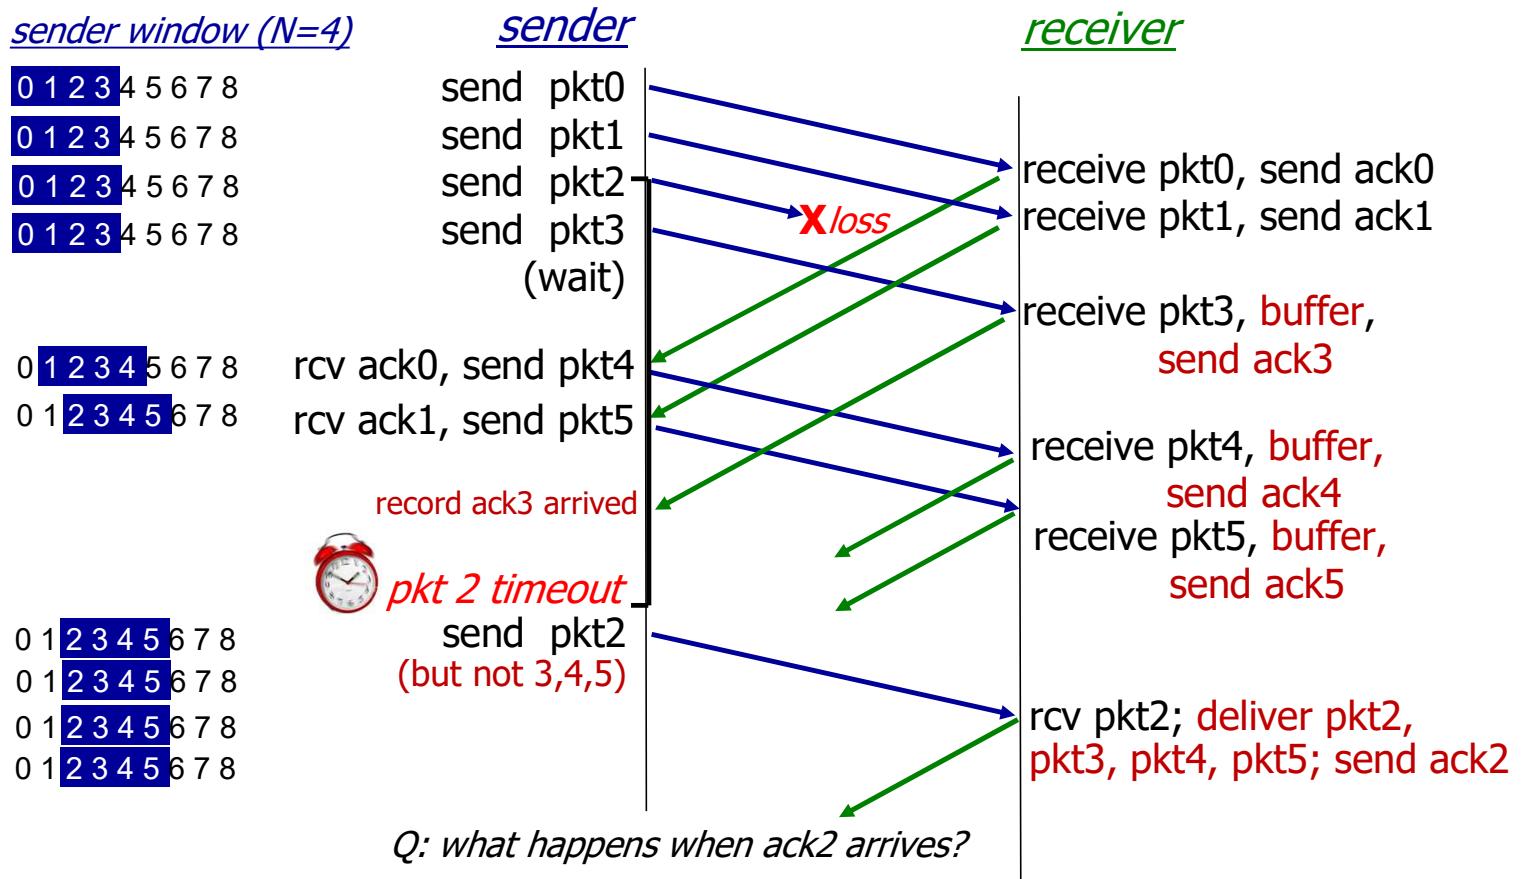

packet n in [rcvbase-N,rcvbase-1]

- ACK(n)

otherwise:

- ignore

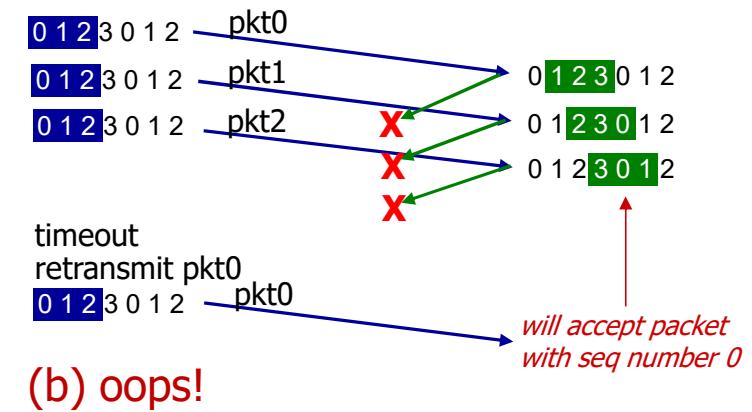

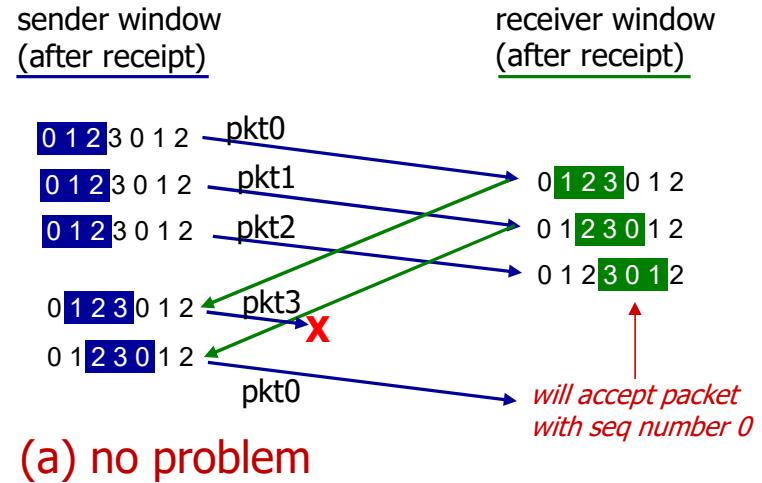

Selective Repeat in action

Selective repeat: a dilemma!

example:

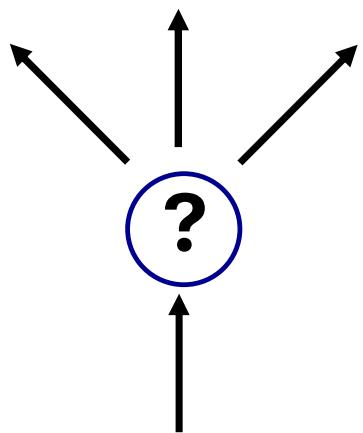

- seq #s: 0, 1, 2, 3 (base 4 counting)
- window size=3

Transport layer: overview

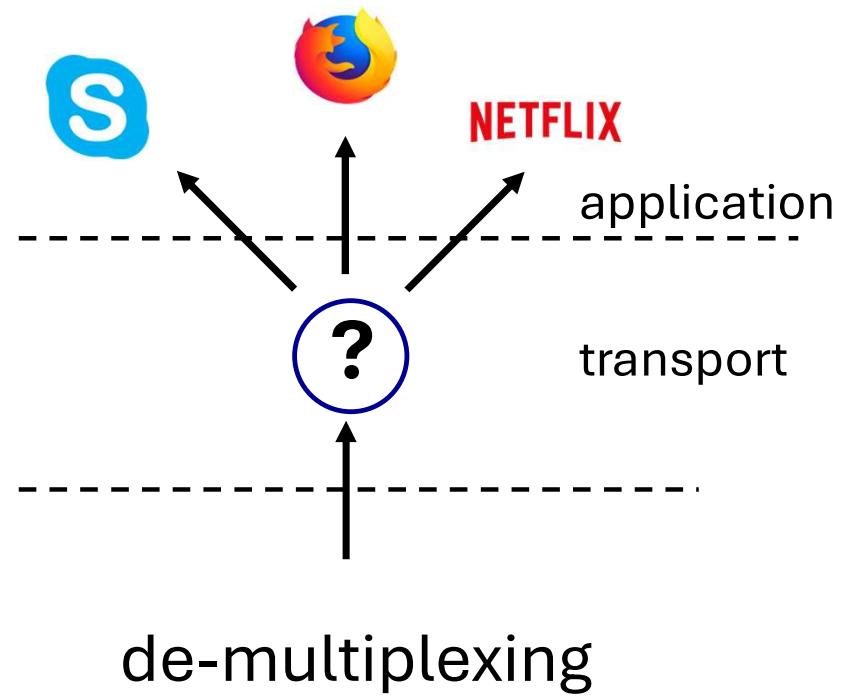

Our goal:

- understand principles behind transport layer services:
 - multiplexing, demultiplexing
 - reliable data transfer
 - flow control
 - congestion control
- learn about Internet transport layer protocols:
 - UDP: connectionless transport
 - TCP: connection-oriented reliable transport
 - TCP congestion control
